# Representation

- We represent a music piece as a sequence of events

$$\mathbf{x} = (\mathbf{x}_1, \ldots, \mathbf{x}_n)$$

- Each event $\mathbf{x}_i$ is encoded as

$$\mathbf{x}_i = (x_i^{type}, x_i^{beat}, x_i^{position}, x_i^{pitch}, x_i^{duration}, x_i^{instrument})$$

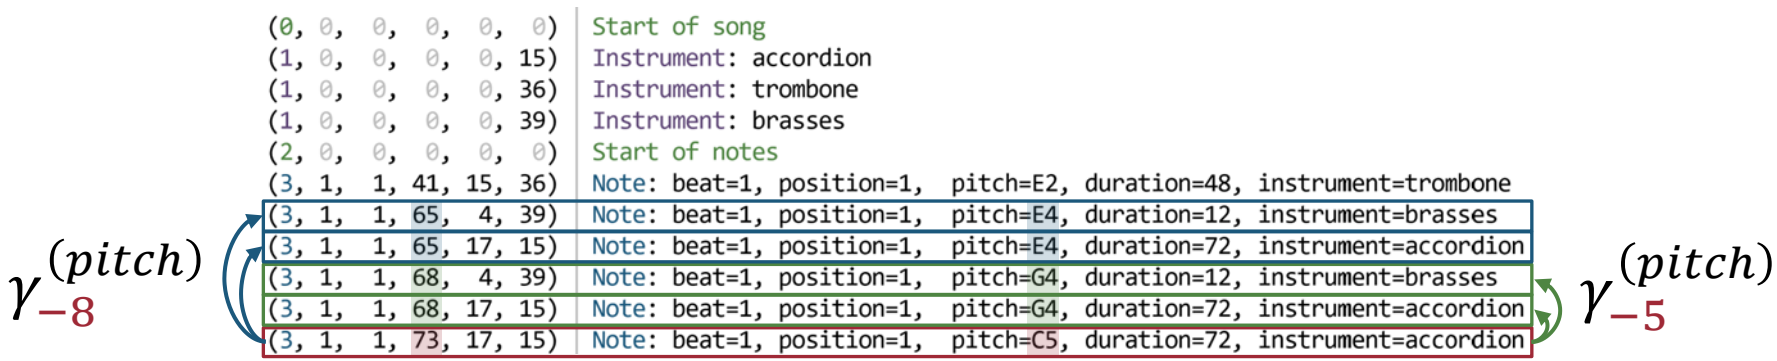
# Analyzing Self-attention

- Mean relative attention for a field $d$:

Attention weight

$$\gamma_k^{(d)} = \frac{\sum_{x \in \mathcal{D}} \sum_{s>t} a_{s,t}(\mathbf{x}) \, 1_{x_t^{(d)} - x_s^{(d)} = k}}{\sum_{x \in \mathcal{D}} \sum_{s>t} a_{s,t}(\mathbf{x})}$$

Whether the field value is of difference $k$



# Analyzing Self-attention

- Mean relative attention for a field $d$:

$$\gamma_k^{(d)} = \frac{\sum_{x \in \mathcal{D}} \sum_{s>t} a_{s,t}(\mathbf{x})\, 1_{x_t^{(d)} - x_s^{(d)} = k}}{\sum_{x \in \mathcal{D}} \sum_{s>t} a_{s,t}(\mathbf{x})}$$

**Biased towards difference that occurred more frequently!**

- Mean relative attention gain for a field $d$:

$$\tilde{\gamma}_k^{(d)} = \gamma_k^{(d)} - \frac{\sum_{x \in \mathcal{D}} \sum_{s>t} 1_{x_t^{(d)} - x_s^{(d)} = k}}{\sum_{x \in \mathcal{D}} \sum_{s>t} \boxed{1}}$$

Assuming a uniform attention matrix

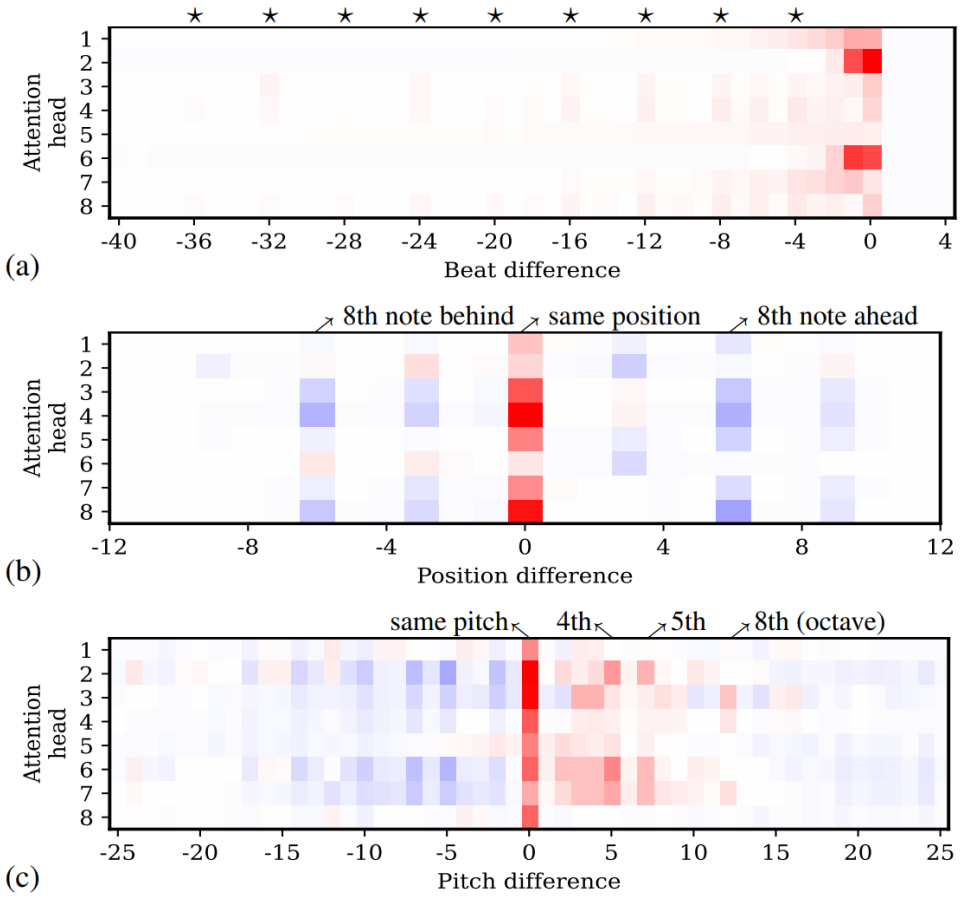
# Musical Self-attention

The MMT model attends more to notes

- that are $4N$ beats away in the past
- that have the same position (e.g., on-beat and off-beat) as the current note
- that has a pitch in an octave above which forms a consonant interval

**MMT learns a relative self-attention for beat, position and pitch.**

Positive and negative mean relative attention gain



# Summary

- Proposed an efficient representation and model for multitrack music generation
- Presented the first systematic analysis of musical self-attention

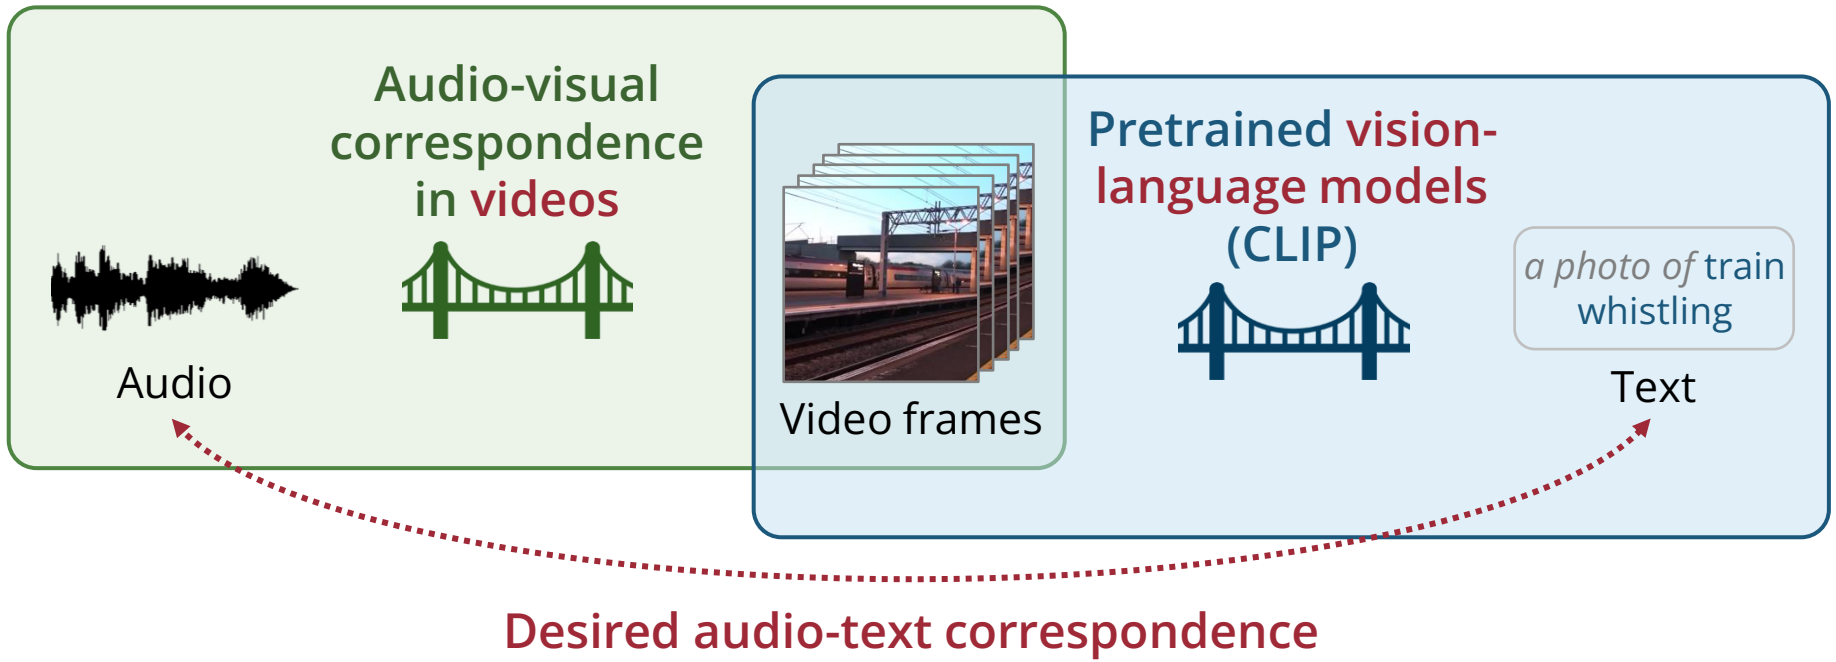
# Leveraging the Visual Domain as a Bridge



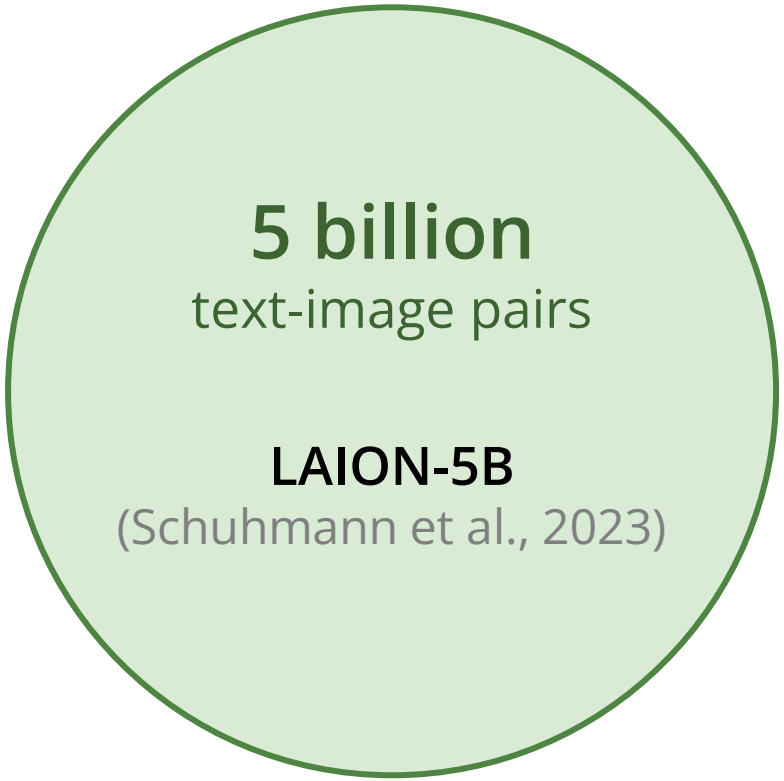
**No text-audio pairs required!**

**Scalable to large video datasets!**

# Why NOT Text-audio Pairs?

**YouTube videos!**

500 hours of videos uploaded per minute



**0.6 million**
text-audio pairs

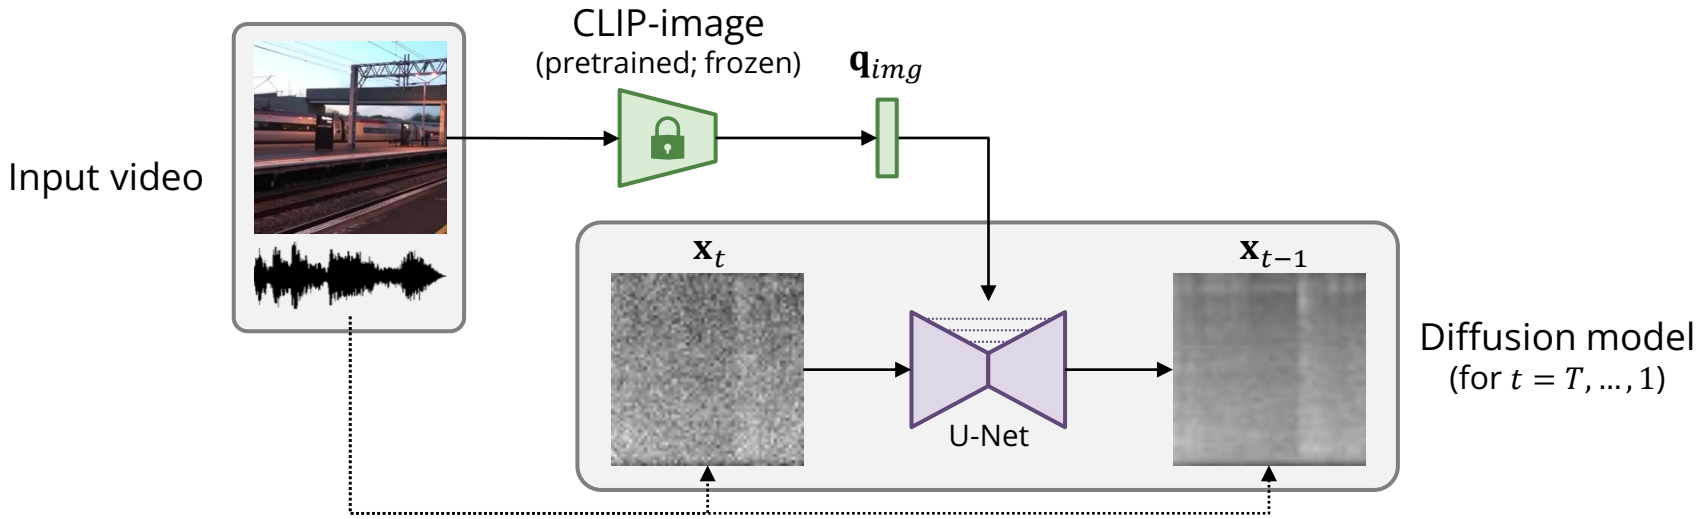
# Training – Image-queried

- We train an image-to-audio synthesis model using a diffusion model on mel spectrograms and a pretrained CLIP-image encoder



# Inference – Zero-shot Modality Transfer (CLIPSonic-ZS)

- We first explore using a pretrained CLIP-text encoder directly

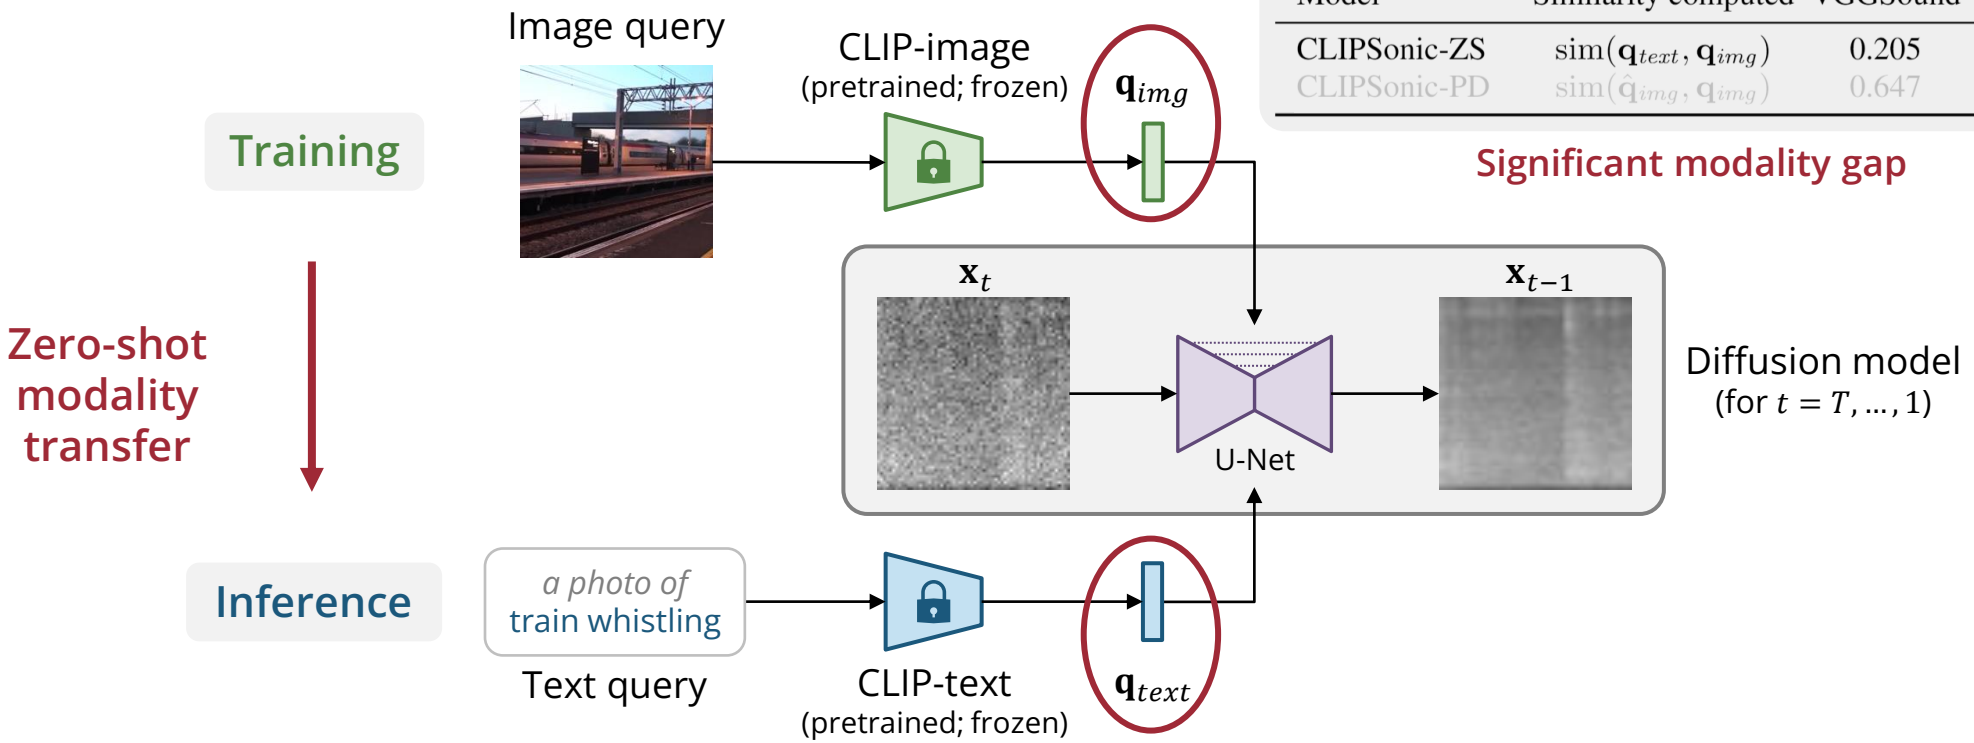


Table 2: Cosine similarities between various query embeddings.

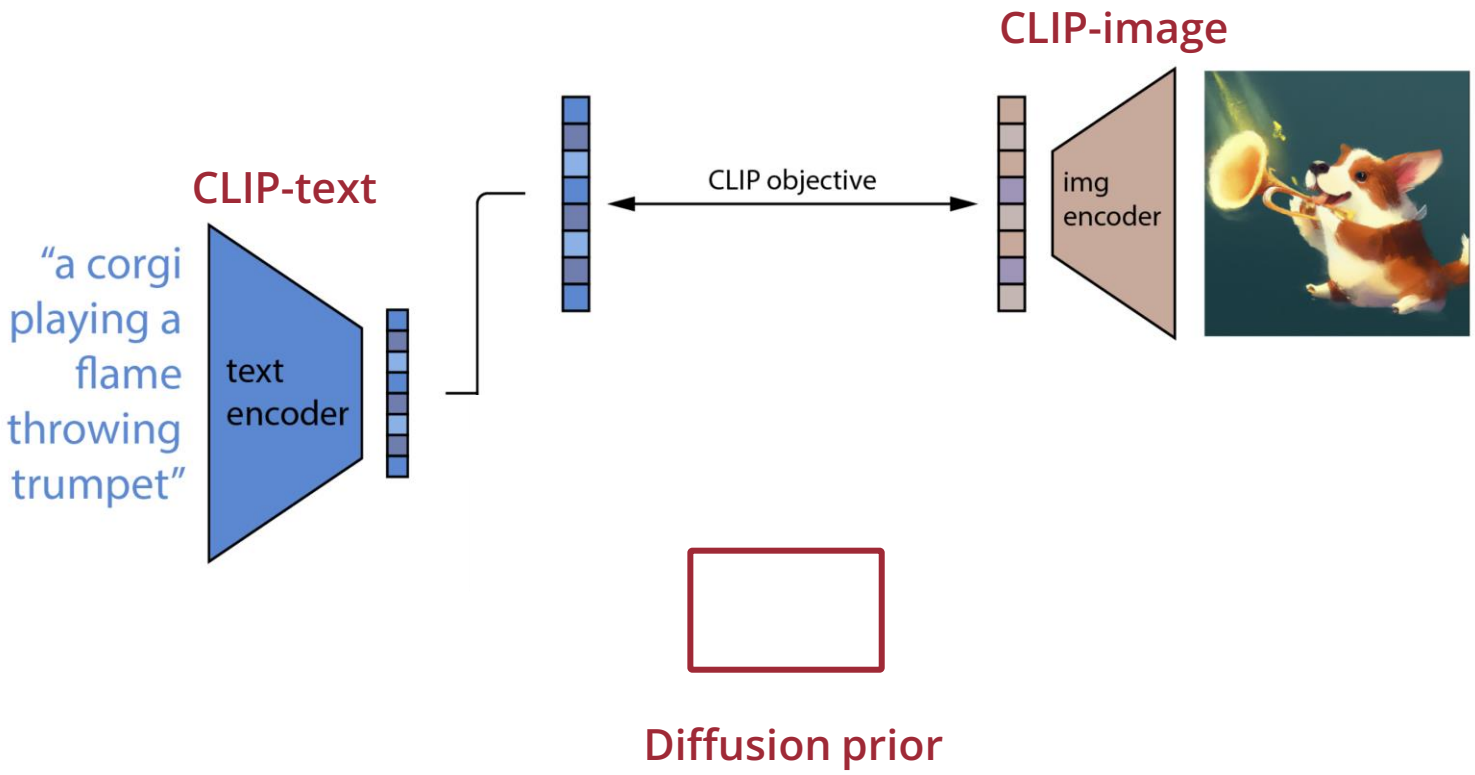
| Model | Similarity computed | VGGSound | MUSIC |
|---|---|---|---|
| CLIPSonic-ZS | $\text{sim}(\mathbf{q}_{text}, \mathbf{q}_{img})$ | 0.205 | 0.245 |
| CLIPSonic-PD | $\text{sim}(\mathbf{q}_{img}, \mathbf{q}_{img})$ | 0.647 | 0.720 |

Significant modality gap

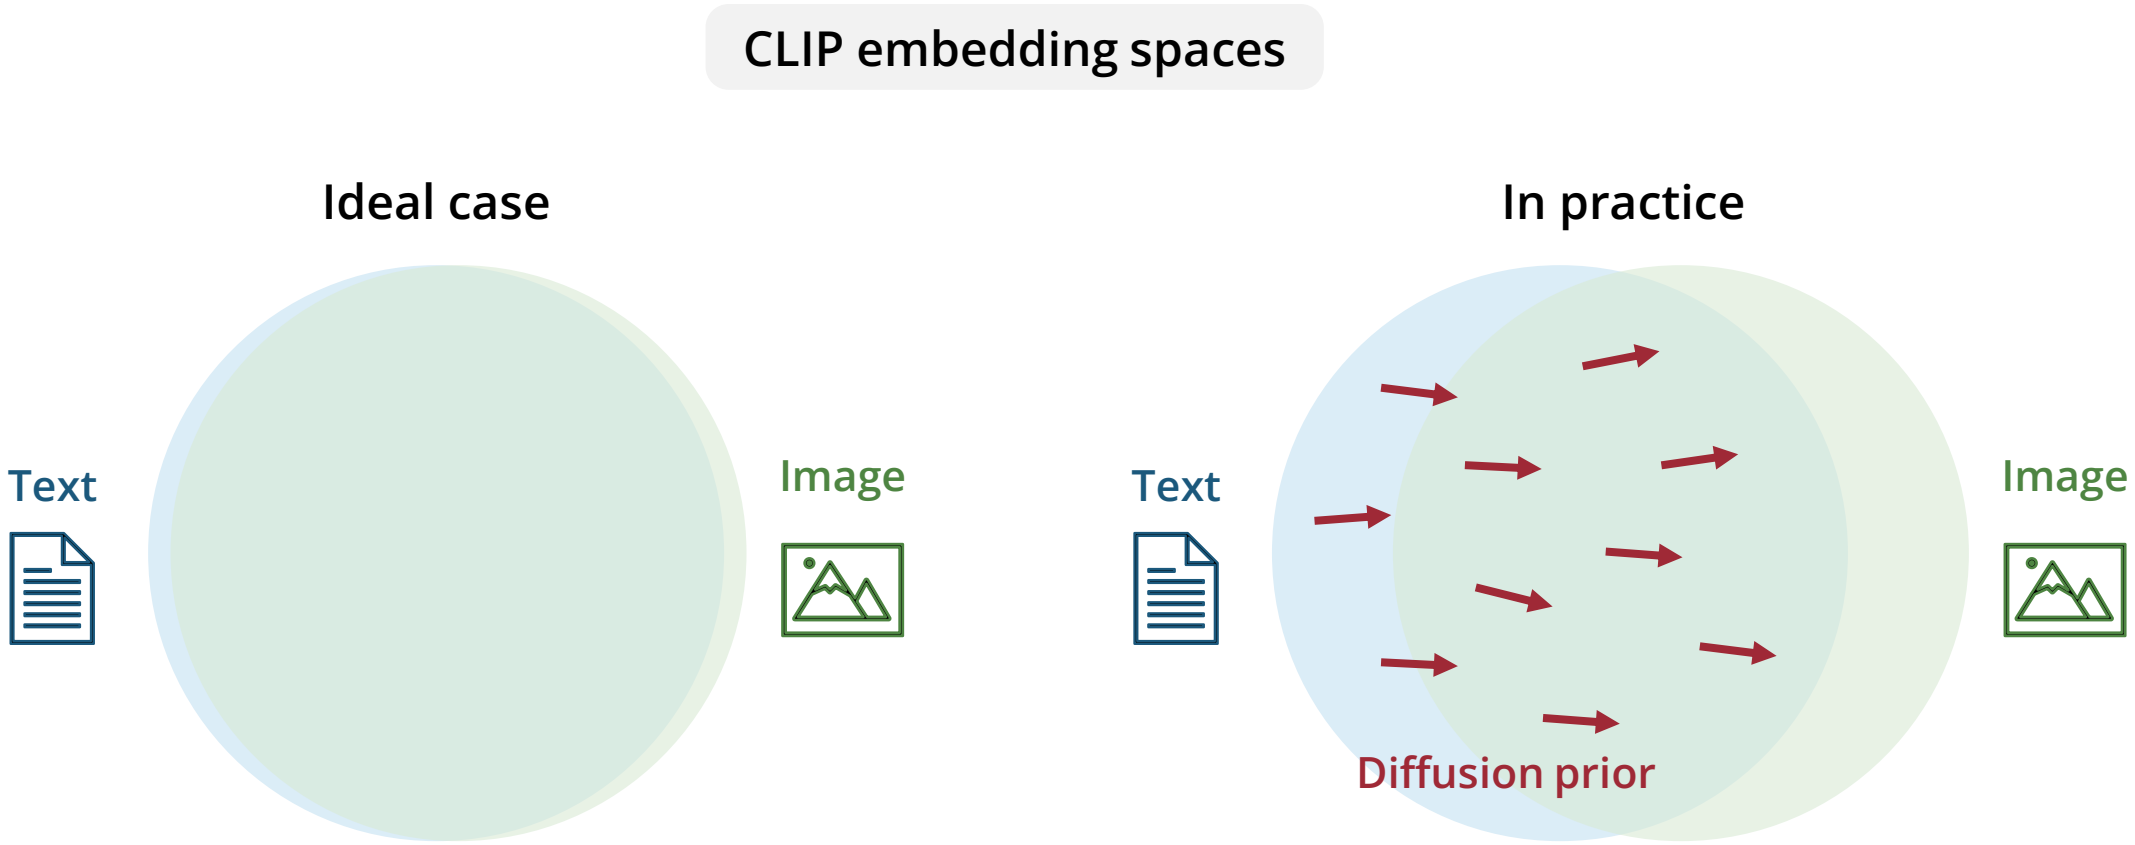
# How to overcome this modality gap?

- We leverage a pretrained diffusion prior model (Ramesh et al., 2022)



Ramesh et al., "Hierarchical Text-Conditional Image Generation with CLIP Latents," *arXiv preprint arXiv:2204.06125*, 2022.

# Diffusion Prior (Ramesh et al., 2022)



Ramesh et al., "Hierarchical Text-Conditional Image Generation with CLIP Latents," *arXiv preprint arXiv:2204.06125*, 2022.

# Inference – Pretrained Diffusion Prior (CLIPSonic-PD)

- We then explore using a pretrained diffusion prior model (Ramesh et al., 2022)

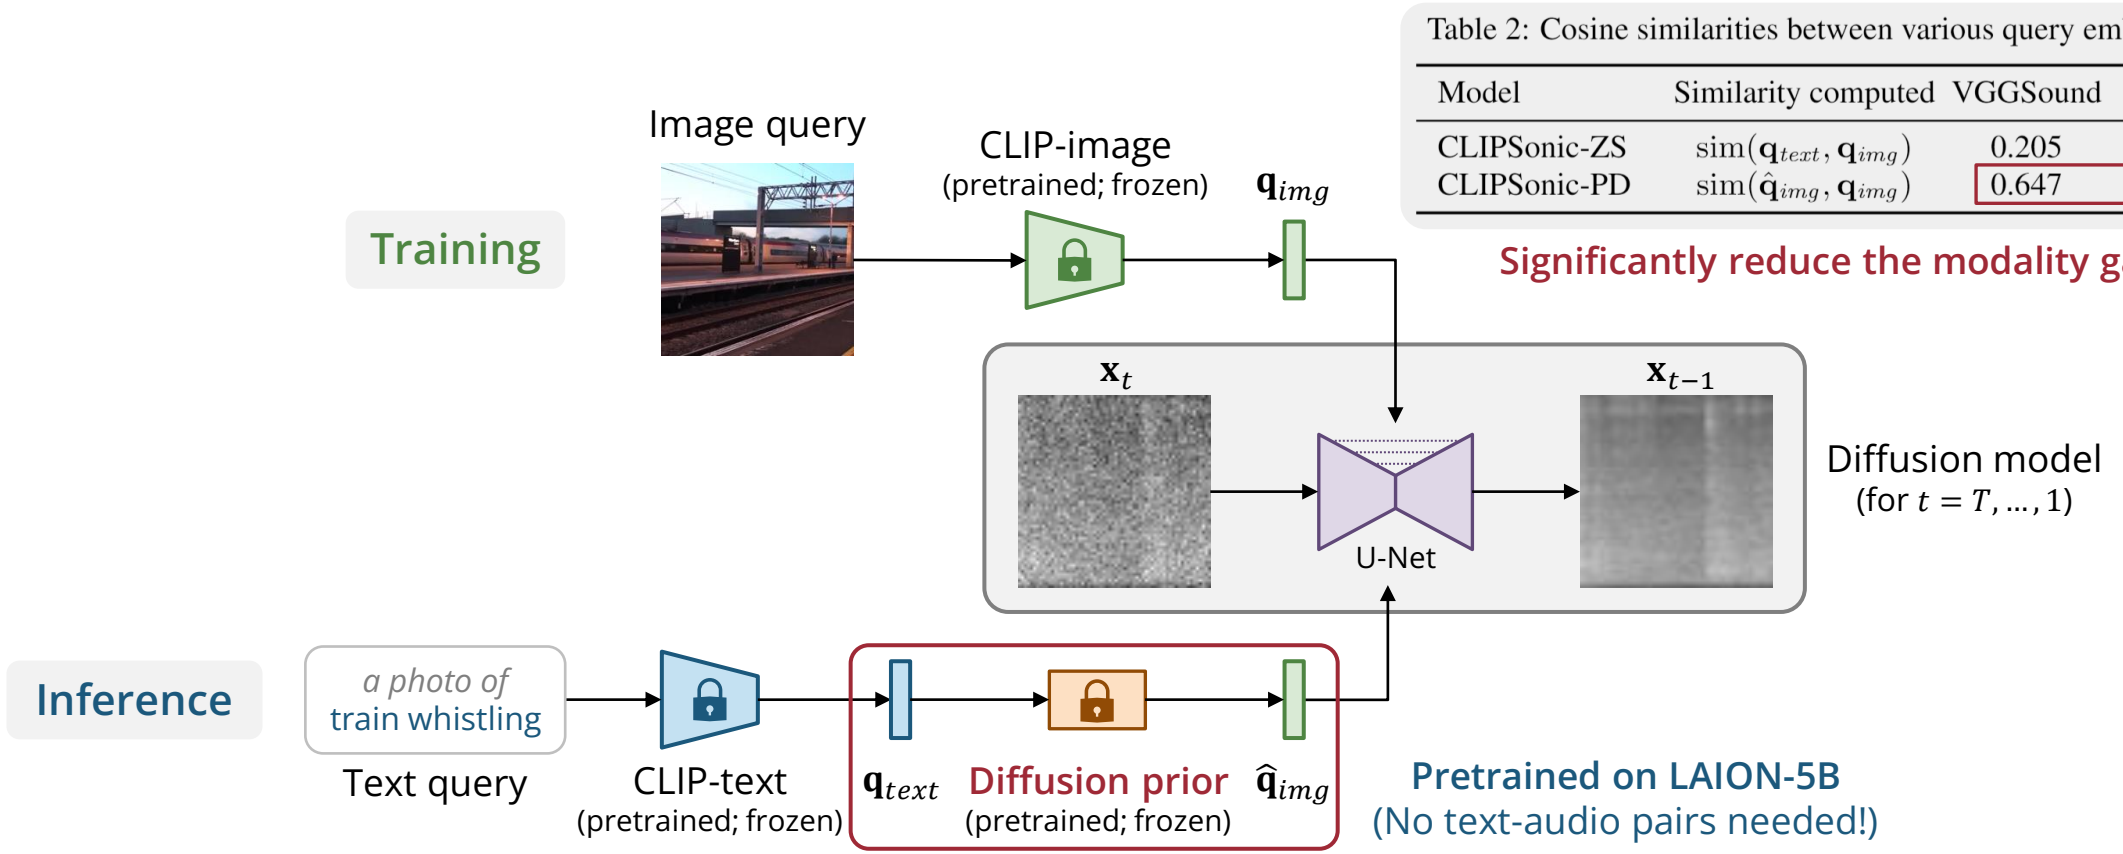


Table 2: Cosine similarities between various query embeddings.

| Model | Similarity computed | VGGSound | MUSIC |
|---|---|---|---|
| CLIPSonic-ZS | $\text{sim}(\mathbf{q}_{text}, \mathbf{q}_{img})$ | 0.205 | 0.245 |
| CLIPSonic-PD | $\text{sim}(\hat{\mathbf{q}}_{img}, \mathbf{q}_{img})$ | 0.647 | 0.720 |
